

Eventus with SAS

Eventus runs in the SAS System to allow users to combine the statistical and data-handling power of SAS with event study methods. An Eventus program consists of a few simple but customizable statements. Options allow users to tailor data input, estimation and statistical testing. Every Eventus program is also a SAS program and can create SAS data sets containing certain types of results. Eventus does not interfere with users' use of other SAS features.

The Business School has licensed Eventus 9 to run with the current setup of SAS 9.1.3.
